

Discourse DB:Install log

This is the approved revision of this page, as well as being the most recent.

The printable version is no longer supported and may have rendering errors. Please update your browser bookmarks and please use the default browser print function instead.

We have the following extensions installed (with version numbers):

- ParserFunctions
- StringFuctions
- SemanticMediawiki
- inputbox.php

We are using rewrites to eliminate index.php from URLs. Instructions are here:

http://meta.wikimedia.org/wiki/Rewrite_Rules

The method we are suing is this:

Using a rewrite rule in a .htaccess file

This method may be useful if you have the ability to use rewrite rules in .htaccess and don't have conf access but it is more work for the httpd.

```
-----
| 1. install mediawiki in the dir for www.mysite.com/w as normal (using the installer)
| 2. set $wgArticlePath = "/wiki/$1"; in LocalSettings.php
| 3. put a htaccess file with the following content in the dir for www.mysite.com
|
|-----
| # close the php security hole...
| # not actually needed but probably a good idea anyway
| php_flag register_globals off
|
| # first, enable the processing - Unless your ISP has it enabled
| # already. That might cause weird errors.
| RewriteEngine on
|
| # uncomment this rule if you want Apache to redirect from www.mysite.com/ to
| # www.mysite.com/wiki/Main_Page
| # RewriteRule ^/$ /wiki/Main_Page [R]
|
| # do the rewrite
| RewriteRule ^wiki/?(.*)$ /w/index.php?title=$1 [L,QSA]
|-----
```

Make sure Apache loads the Rewrite module. In httpd.conf this line must be added/uncommented:

LoadModule rewrite_module modules/mod_rewrite.so
